

## Problem #1 - Jerseys for Sale!

Carolyn gets a job at the Sky Dome selling Jose Bautista baseball jerseys. She is paid a \$10 flat fee plus \$10 for every jersey she sells. Let her total pay be  $p$  (\$) and the number of jerseys she sells  $n$ .

1. Which is the independent variable, and which dependent?
2. Make a table of values and graph showing her pay for various numbers of jerseys sold.

$n$	$p$
0	
5	
10	
15	
20	
25	

3. What is an equation for Carolyn's total pay?
4. What is Carolyn's pay if she sells 0 jerseys? Where is this on your graph?
5. Use your equation to find out how much she would be paid if she sold 17 jerseys.
6. Use your graph to find how many jerseys she would need to sell to earn \$200.00 for a game.
7. Use your equation to answer question #6.

8. What would the equation be if Carolyn were paid:

a. \$15 flat fee, plus \$7.50 per jersey sold?

b. \$10 flat fee, plus \$9 per jersey?

c. \$15 flat fee, plus \$5 per jersey?

d. \$20 flat fee only?

e. \$8 per jersey only?

## Problem #2 - Ring It Up!

A phone company charges a flat monthly fee of \$15 for cell phone service, plus an additional fee for every minute you talk. In a given month, you are charged \$36 for the 24 minutes you talked (not including the \$15 flat fee). Let the total cost be  $c$  (in \$), and the time you talk be  $t$  (in minutes).

1. Identify the dependent and independent variables.
2. What is the “fixed” cost of the phone plan?
3. What cost do you pay per minute? (this is known as the variable cost or constant of variation)
4. Write an equation relating  $c$  and  $t$ .
5. Draw a graph showing the total phone bill for one month where the calls vary from 0 to 50 minutes. Use increments of 10 minutes.

### Problem #3 - Decisions, Decisions, Decisions!

You are helping a friend decide which cellular phone package is best for her to buy.

-Crystal Net charges a basic fee of \$27 for up to 200 minutes (no charge per minute)

-Rover charges a basic fee of \$12 plus \$0.15 per minute

-Ring Mobility charges a basic fee of \$15, plus \$0.10 per minute.

1. Identify your dependent and independent variables.

2. Write an equation showing the cost for each of the three cell phone companies (3 equations)

3. The graphs of the 3 equations from #2 look like this. Which lines match which equations from #2? How do you know?

4. When are the costs the same for the Rover and Crystal Net options?

7. When is Crystal Net the best option?

5. When are the costs the same for the Rover and Ring Mobility options?

8. If your friend expects to use her cell phone between 40 and 100 minutes per month, explain which service you think she should choose.

6. When is Ring Mobility a better deal than both Rover and Crystal Net?

## **Problem #4**

A mobile phone company charges a flat fee of \$20 and a cost per minute. When your phone bill comes, you discover that you talked for 150 minutes, and your total bill was \$72.50 including the flat fee. Determine:

- a) the cost per minute of talk time
  
- b) an equation showing the relationship (partial variation equation:  $y=mx+b$ )
  
- c) how much it will cost (including the flat fee) to talk for 275 minutes (use your equation)
  
- d) how long you talked for if your total bill came to \$51.15 (use your equation)

## **Problem #5**

An airplane traveling at an altitude of 5000 m begins descending (going downwards) at a constant rate. After 15 seconds, the airplane has descended 72 m. Determine:

- a) the constant of variation for this situation
  
- b) an equation showing the relationship
  
- c) the altitude of the plane after 75 seconds (use the equation)
  
- d) how long it will take the plane to land.
