

## Grade 10 Math Review Tutorial

<https://youtu.be/Veb22xD0Ao0>

### Unit 1 – Linear Systems

1) Solve the following linear system in 3 ways: GRAPHING, SUBSTITUTION, and ELIMINATION

$$x - y = 5$$

$$3x + y = 3$$

#### Solving by GRAPHING

- 1) Re-arrange both equations into the form  $y = mx + b$
- 2) Use the slope ( $m$ ) and the y-int ( $b$ ) to graph both lines.
- 3) The point of intersection is the solution to the system.

#### Solving by ELIMINATION

- 1) Re-arrange both equations into the form  $x + y = \#$
- 2) Make the coefficients of either the  $x$  or  $y$  variables have the same absolute value by multiplying either or both equations by a constant.
- 3) Add or Subtract the equations to eliminate a variable
- 4) Solve for the remaining variable
- 5) Plug answer back in to either original equation to solve for the OTHER variable.

#### Solving by SUBSTITUTION

- 1) Re-arrange either equation to isolate a variable ( $x$  or  $y$ )
- 2) Substitute what the isolated variable is equal to into the OTHER equation
- 3) Solve the new equation for the variable
- 4) Plug answer back in to either original equation to solve for the OTHER variable.

2) Solve the following linear system using the method of elimination

$$4x + 3y = 13$$

$$5x - 4y = -7$$

**Tip:**

If variables have the SAME sign, SUBTRACT to eliminate

If variables have the OPPOSITE sign, ADD to eliminate

3) The Sports Shop sells Adidas running shoes for \$82 a pair and Air Jensen basketball shoes for \$95 a pair. One day, the Sports Shop sells a combined 75 pairs of Adidas and Air Jensen shoes totaling \$6241 in sales. How many pairs of each shoes were sold?

**Tip:**

Remember that these questions are designed so that there are 2 variables that need to be solved for.

They will ALWAYS give you enough information to make 2 equations involving these 2 variables.

## Unit 2 – Analytic Geometry

4) Calculate the midpoint and distance between the following points

$A(5, -3)$  and  $B(-1, 5)$

Formulas Needed

**Midpoint:**  $\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$

**Distance:**  $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

5) Draw the triangle with vertices  $A(-1, 3)$ ,  $B(1, 5)$  and  $C(3, 1)$ . Draw the median from vertex  $C$  to  $AB$ . Then find the equation of this median.

### Median

A median of a triangle is the line segment that joins a vertex to the midpoint of the opposite side.

6) Determine the equation for the right bisector of the line segment with endpoints A(-2,-4) and B(8,6)

7) Classify the triangle with vertices of D(-4, -2), E(-2, 6), and F(6, -4) as either scalene, isosceles, or equilateral. Also state if it has a right angle.

Formula Needed

**Distance:**  $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

**Tip:**

If a triangle has a RIGHT angle,  
Pythagorean Theorem will hold true.

$$a^2 + b^2 = c^2$$

8) What is the radius of the circle  $x^2 + y^2 = 36$ ?

9) For the circle that is centered at the origin and passes through the point  $(-3,4)$

a) Find the equation of the circle

Formulas Needed

Equation of ANY Circle:

$$(x - h)^2 + (y - k)^2 = r^2$$

Equation of Circle Centered at ORIGIN:

$$x^2 + y^2 = r^2$$

b) Does the point  $(5,2)$  lie on the circle, inside of it, or outside of it?

Tip:

If point  $(x, y)$  is **ON** the circle  $\rightarrow x^2 + y^2 = r^2$

If point  $(x, y)$  is **OUTSIDE** the circle  $\rightarrow x^2 + y^2 > r^2$

If point  $(x, y)$  is **INSIDE** the circle  $\rightarrow x^2 + y^2 < r^2$

10) What is the shortest distance from the point at (-3,5) to the line  $y = \frac{1}{4}x + 10$

#### STEPS FOR FINDING SHORTEST DISTANCE

- 1) Find equation of a line that is perpendicular to the original line and passes through the given point.
- 2) Find where that line intersects the original line.
- 3) Find the distance from the original point to the point where the lines intersect.

#### Tip:

The shortest distance from a POINT to a LINE is always the in a direction that is PERPENDICULAR to the line.

## Unit 2 – Quadratics

**Standard Form:**  $y = ax^2 + bx + c$

**Vertex Form:**  $y = a(x - h)^2 + k$

**Factored Form:**  $y = a(x - r)(x - s)$

jensenma

11) For the quadratic  $y = -2(x + 4)^2 + 3$ , complete the table of information, and then graph the function using its properties and a table of values.

Property	$y = -2(x + 4)^2 + 3$	$x$	$y$
Vertex			
axis of symmetry			
stretch or compression			
direction of opening			
values that $x$ may take			
values that $y$ may take			

12) Find vertex form equation of the following quadratic.

**13)** Describe the transformations from  $y = x^2$  to  $y = -\frac{1}{3}(x + 5)^2 - 4$

**14)** For the quadratic  $y = -4(x - 2)(x - 4)$ , state the  $x$ -intercepts, vertex and axis of symmetry. Then use this information to graph it.

**15)** A parabola has  $x$ -intercepts  $-8$  and  $2$ , and passes through the point  $(0, -8)$ . Determine the equation of this parabola in the form  $y = a(x - r)(x - s)$ .

**Standard form to factored form**

$$ax^2 + bx + c \rightarrow a(x - r)(x - s)$$

**16)** Factor each of the following

**Tip:**

ALWAYS check for a common factor first!

**a)**  $y = x^2 + 10x + 24$

**b)**  $y = x^2 + x - 12$

**c)**  $y = 2x^2 + 22x + 48$

**d)**  $y = 2x^2 + 7x - 15$

**e)**  $y = 3x^2 + 23x - 8$

**f)**  $y = x^2 - 16$

**g)**  $y = 4x^2 - 25$

**h)**  $y = x^2 + 6x + 9$

Factored to standard

$$a(x - r)(x - s) \rightarrow ax^2 + bx + c$$

17) Expand each of the following into standard form

a)  $(4x - 1)(x + 7)$

b)  $(x - 5)^2$

Standard form to vertex form

$$ax^2 + bx + c \rightarrow a(x - h)^2 + k$$

18) Convert each of the following into vertex form by completing the square.

a)  $x^2 + 6x + 11$

b)  $3x^2 + 24x - 17$

**Completing the Square Steps**

$$ax^2 + bx + c \rightarrow a(x - h)^2 + k$$

- 1) Put brackets around the first 2 terms
- 2) Factor out the constant in front of the  $x^2$  term
- 3) Look at the last term in the brackets, divide it by 2 and then square it
- 4) Add AND subtract that term behind the last term in the brackets
- 5) Move the negative term outside the brackets by multiplying it by the 'a' value
- 6) Simplify the terms outside the brackets
- 7) Factor the perfect square trinomial  
 $a^2 + 2ab + b^2 = (a + b)^2$

19) Solve each of the following quadratic equations using the most appropriate method.

**Quadratic Formula:**

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

**Difference of Squares:**

$$a^2 - b^2 = (a - b)(a + b)$$

**Tip:**

Always try to solve by factoring BEFORE resorting to quadratic formula.

**Tip:**

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Quadratic formula will give you:

2 solutions if  $b^2 - 4ac > 0$

1 solutions if  $b^2 - 4ac = 0$

0 solutions if  $b^2 - 4ac < 0$

a)  $0 = x^2 - 36$

b)  $x^2 + 4x = 21$

c)  $-x^2 + 5x + 6 = 0$

d)  $5x^2 - 19x = 4$

e)  $x^2 + 7x + 5 = 0$

f)  $0 = 2x^2 + 4x + 7$

20) Sketch a graph and label all key properties of  $y = x^2 + 8x + 12$

21) An object is launched upward at 64 feet per second (ft/s) from a platform 80 feet high. The equation for the object's height in ft based on time in seconds is given by  $h = -16x^2 + 64x + 80$

a) When does the object land on the ground?

b) What is the max height of the object?

c) When is the object 100 feet off the ground?

**Tip:**

These questions are always going to ask you for the  $x$ -intercepts and vertex.

Ground  $\rightarrow$   $x$ -int

Max or Min  $\rightarrow$  vertex

### Unit 3: Trigonometry

Rule	When to Use It	
<b>Pythagorean Theorem</b> $a^2 + b^2 = c^2$	Right Triangle Know: 2 sides Want: 3 <sup>rd</sup> side	
$S \frac{O}{H} C \frac{A}{H} T \frac{O}{A}$	Right Triangle Know: 2 sides Want: Angle (use inverse ratio)	Right Triangle Know: 1 side, 1 angle Want: Side
<b>Sine Law</b> $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$	Oblique Triangle (no right angle) Know: 2 sides and opposite angle Want: Angle	Oblique Triangle (no right angle) Know: 1 side and all angles Want: Side
<b>Cosine Law</b> $a^2 = b^2 + c^2 - 2bc(\cos A)$ $\cos A = \frac{a^2 - b^2 - c^2}{-2bc}$	Oblique Triangle Know: 2 sides and contained angle Want: 3 <sup>rd</sup> side (use top formula)	Oblique Triangle Know: All 3 sides Want: Angle (use bottom formula)

What is  $S \frac{O}{H} C \frac{A}{H} T \frac{O}{A}$  ?

If we know a right-angle triangle has an angle of  $\theta$ , all other right-angle triangles with an angle of  $\theta$  are **similar** and therefore have equivalent ratios of corresponding sides. The three primary ratios are shown in the diagram to the right.

$$\sin \theta = \frac{\text{opposite}}{\text{hypotenuse}}$$

$$\cos \theta = \frac{\text{adjacent}}{\text{hypotenuse}}$$

$$\tan \theta = \frac{\text{opposite}}{\text{adjacent}}$$

22) Find the indicated missing side or angle in each triangle:

a)

b)

c)

d)

e)

f)

g)
